AI Masterclass + Mega Quiz

Workshop Presentation & Conclusion Guide

Workshop: AI Masterclass + Mega Quiz
Theme: Build. Deploy. Learn. Compete. Win.
Journey: Idea → AI Application → Live Product

How to Present the Workshop

Don't present this like a college PPT. Present it like you are building something together with the audience.

Suggested 2 Hour 15 Minute Flow

• 10:30–10:38 — Opening + audience interaction

• 10:38–10:45 — What we're building

• 10:45–11:00 — Tech stack + architecture

• 11:00–11:25 — Next.js + GitHub

• 11:25–11:45 — Frontend + Backend

• 11:45–12:00 — AI API + Security

• 12:00–12:15 — Supabase + Authentication

• 12:15–12:25 — Deployment + Debugging

• 12:25–12:40 — Mega Quiz

• 12:40–12:45 — Closing + Q&A;

Slide-by-Slide Speaking Guide

Slide 1 — Opening

• “Good morning everyone!”

• “Before we start, I want to ask you one simple question.”

• “How many of you have used ChatGPT?”

• “Okay, now a slightly harder question. How many of you have actually built an application that uses AI?”

• “And that’s exactly what we’re going to change today.”

• “Today we’re not just going to talk about AI. We’re going to build with AI.”

Slide 2 — What Are We Building Today?

• “Let me first show you where we’re going.”

• “Imagine I have a website where you type a question.”

• “That question goes from our frontend to our backend.”

• “The backend communicates with an AI model.”

• “The response comes back.”

• “And instead of losing that response, we’re going to save it in a database.”

• “Finally, our application is going to be live on the internet.”

• “So by the end of this workshop, we’re not going to have just a PowerPoint. We’re going to understand the architecture behind a real AI application.”

Slide 3 — The Modern AI App Stack

• “Think of building an application like building a house.”

• “Next.js is where we build the application.”

• “GitHub is where we keep our blueprint and code.”

• “The AI API gives our application intelligence.”

• “Supabase gives our application memory.”

• “And Vercel puts the final application on the internet.”

• “Five technologies. One application.”

• Ask: “Which one of these have you used before?”

Slide 4 — Architecture

• “Let’s follow one request.”

• “Imagine you type: Explain Machine Learning.”

• “Step one: your browser sends this request to our Next.js frontend.”

• “Step two: the frontend sends the request to our API route.”

• “Step three: our backend talks to the AI.”

• “The AI generates the answer.”

• “Then we can save that answer in Supabase.”

• “And finally, the answer comes back to the user.”

• “That’s the entire journey of one AI request.”

• Ask: “Where do you think the API key should be stored?”

Slide 5 — Setup

• “Before we build, we need four things.”

• “A place for our code. A place to deploy. A database. And an AI provider.”

• “If you’re following along on your laptop, make sure these accounts are ready.”

Slide 6 — Create Next.js App

• “Now let’s stop talking and build.”

• Run: npx create-next-app@latest ai-app

• “This command is basically saying: Next.js, create a new application for me.”

• Run: cd ai-app

• Run: npm run dev

• Open: http://localhost:3000

• “This is our first milestone.”

• “We started with an empty folder... and now we have a running web application.”

Slide 7 — GitHub

• “Now imagine your laptop crashes. What happens to your project?”

• “That’s one reason GitHub is important.”

• “GitHub is not just Google Drive for code.”

• “It gives us version control.”

• “We can see what changed, go back to previous versions, and multiple developers can work together.”

• “Code → Add → Commit → Push → GitHub.”

Slide 8 — Vercel

• “Right now our application works on my laptop.”

• “But can you open localhost:3000 from your phone? No.”

• “So how do we put it on the internet?”

• “That’s where Vercel comes in.”

• “We push our code to GitHub. Vercel detects the repository. It builds the application. And gives us a public URL.”

• “Whenever I change my code and push it to GitHub, Vercel can automatically deploy the new version.”

Slide 9 — Next.js Fundamentals

• “Think about Instagram. You have different screens: Home, Profile, Messages. Those are different routes/pages.”

• “If the navbar appears on every page, instead of writing it again and again, we create a reusable component.”

• “State is simply information that can change while the application is running.”

• “For example: what the user typed, whether we’re loading, and what response the AI gave us.”

Slide 10 — Frontend

• “Let’s imagine our application has one input box and one button.”

• “You type: Explain Machine Learning.”

• “You click Generate.”

• “The frontend captures the question, sends it to our backend, the backend sends it to AI, the AI sends the response back, and our frontend displays it.”

• Ask: “So is the frontend talking directly to the AI?”

• “No. And that’s important.”

Slide 11 — Backend

• “This is our middle layer.”

• “The frontend should not directly communicate with sensitive services.”

• “Instead, we create an API route.”

• “The backend validates the input, calls the AI, communicates with the database, handles errors, and most importantly, protects our secrets.”

• “Browser → Backend/API Route → AI + Database.”

Slide 12 — AI as a Service

• “When students hear AI application, many people immediately think: I need to train my own AI model.”

• “Not necessarily.”

• “Modern AI APIs allow us to use powerful existing models inside our applications.”

• “Our application sends a request. The AI provider processes it. We receive the response. And we show it to the user.”

• “Think of AI as electricity. You don’t build a power plant every time you want to use electricity. You connect your application to the service.”

• “AI becomes a feature of our application.”

Slide 13 — Security

• “Now I’m going to tell you one thing that can save you from a very expensive mistake.”

• “Never expose your API key.”

• Ask: “If I put my API key inside frontend JavaScript, can a user inspect the website?”

• “Exactly. Anyone could potentially find that key.”

• “Browser → API Route → Environment Variable → AI Provider.”

• “Treat your API key exactly like your password.”

• Important for live demo: Never put a real API key on the projector. Use .env.local and hide the value.

Slide 14 — Supabase

• “Our AI application can now answer questions. But what happens when I refresh the page?”

• “The conversation disappears.”

• “Our application needs memory.”

• “That’s where Supabase comes in.”

• “We can store the prompt, the AI response, and when it was created.”

• “Now when the user comes back, we can retrieve their previous conversations.”

Slide 15 — Authentication

• “Now there’s one more problem.”

• “What if I have 100 users? Should everyone see everyone’s conversations?”

• “Exactly. That’s why we need authentication.”

• “Authentication lets us connect the data to the correct user.”

Slide 16 — Deployment + Debugging

• “Now, something important: Your application will probably break.”

• “And that’s completely normal.”

• “Professional developers aren’t people who never get errors. Professional developers know how to debug errors.”

• “Error → Understand → Locate → Check Logs → Fix → Test.”

• “AI not responding? Check the API key.”

• “Database not working? Check Supabase.”

• “Works locally but not online? Check Vercel environment variables.”

Slide 17 — Closing + Mega Quiz

• “Let’s stop for a second. Look at where we started.”

• “We started with an idea. And now we understand the journey to a live AI product.”

• “Idea. Code. AI. Database. Deploy. Product.”

• “That’s the difference between someone who only uses AI... and someone who builds with AI.”

• “Now let’s see how much you actually remember.”

• “MEGA QUIZ TIME!”

How You Should Behave on Stage

Don’t: “Next slide. Next.js is a React framework. Next slide...”

Do: Use Question → Explanation → Demo → Question → Next concept.

Audience Questions

• “How many of you have used ChatGPT?”

• “How many of you have built an AI application?”

• “Where does the API key belong — frontend or backend?”

• “What happens to our data if we don’t have a database?”

• “Why do we need GitHub?”

• “What happens when our application works locally but fails after deployment?”

• “Who here wants to build their own AI application after this workshop?”

Most Important: Live Demo

Try to actually show: Create Next.js app → Run localhost → Create UI → API Route → AI API → Supabase → GitHub → Vercel → LIVE AI APP.

If the live demo breaks, don’t panic. Say: “Perfect. We just got our first debugging problem.” Then debug it. That can become one of the best parts of the workshop.

Final 60-Second Closing — Memorize This

“So, before we end, I want you to remember just one thing from today’s workshop.”

“AI is not something that you only use through ChatGPT or other tools.”

“AI is something you can build into your own ideas.”

“Today, we saw the complete journey — from an idea, to code, to integrating AI, storing data, and finally deploying an application.”

“You don’t need to wait until you’re an expert to start building.”

“Start with a small idea. Build it. Break it. Debug it. Improve it.”

“Because the goal isn’t just to become someone who uses AI…”

“…the goal is to become someone who builds with AI.”

“So take the idea you have in your head today — and turn it into something people can actually use.”

“Thank you everyone for being here.”

(Pause, smile)

“And now… let’s find out who was actually paying attention.”

“MEGA QUIZ TIME!”

Stage Tip: After saying “build with AI”, stop for 2–3 seconds. Don’t immediately continue. Let the line land. Then smile and say: “MEGA QUIZ TIME!”
